# UC Berkeley tests floating robot sensors to track water flow, environmental concerns

The sensors are built with GPS-enabled smartphones

It's been a couple of years and a couple of million dollars. Finally, researchers and graduate students who have spent years developing intelligent water sensors released them into the Sacramento River on Wednesday, about 80 miles east of San Francisco.

That area of the river is a mixture of salt water from the nearby San Francisco Bay area. Altogether, the water within the Delta region supplies two-thirds of California's drinking water.

Researchers hope that their sensors will be able to help track environmental spills and the flow of water, which could also help improve salmon spawning.

"This is the way of the future," said Alexandre Bayen, associate professor at the University of California, Berkeley who is supervising the project, called the Floating Sensor Network. "We're moving from an age when humans were deploying things and baby-sitting them to an age where you just put the robots in the water, they do their job, they come back or they call you if they have a problem."

Watch a video of the sensors entering the water, [here](#).

Some of the sensors are equipped with Android smart phones inside their waterproof cases. A few of them auto-post to Twitter whenever they are in use. Check [@fsnandroid61](#).

Researchers from University of California, Berkeley, San Francisco State University, The Center for Information Technology Research in the Interest of Society and the Lawrence Berkeley National Laboratory helped with the project.

WHITEPAPERS

**Reconciling Datacenter consolidation and security: It starts with an integrated approach**

There is no question that datacenter consolidation has gone mainstream. A recent IDG Research survey of IT managers found that three out of four organizations are in the midst of, or just completing, consolidation of multiple applications or systems onto a smaller number of servers. Improving performance and availability was the key driver of consolidation efforts for 85% of those surveyed.

**Oracle Exadata Database Machine Warehouse Architectural Comparisons**

Exadata is Oracle's fastest growing new product. Much of the growth of Exadata has come at the expense of specialized data warehouse appliance vendors. These vendors have published competitive comparisons to Exadata, claiming: Architecture is what really matters for performance. Purpose-built data warehousing architectures perform best. They see architecture as an end in itself rather than as a means to an end. [Read on.](#)
